

Introducing

Maternity Warden

Make labor less painful.

Calving brings new life to a dairy: a calf is born, and lactation begins. However, this transitory period is also a time of significant risk.

Farm data shows that upwards of 7% of calves on U.S. dairy farms perish within 48 hours of birth. Calving dams fare just a little better or risk permanent injury.

Humane and Reliable Maternity Monitoring

Maternity Warden is a computer vision monitoring solution for your close-up area powered by artificial intelligence. It automatically, passively, and objectively monitors your herd and alerts you to cows in labor. Early identification of calving lowers stillborn rates and the duration time to intervene which subsequently lowers dystocia incidents.

Technology to Protect Mothers and Calves

- Always-on close-up pen monitoring
- Objective calving identification
- 24/7 alerts of imminent calving

Empower Your Farm with Maternity Monitoring

- Reduce stillborns and birth complications
- Eliminate round-the-clock dedicated supervision
- Create timestamps for critical events
- Dispatch labor only when necessary
- Receive notifications to assist or to confirm a birth
- SOP compliance, preventing fabrication

Maternity Warden ensures that you're ready to make every birth a success.
